Hack-A-Gent

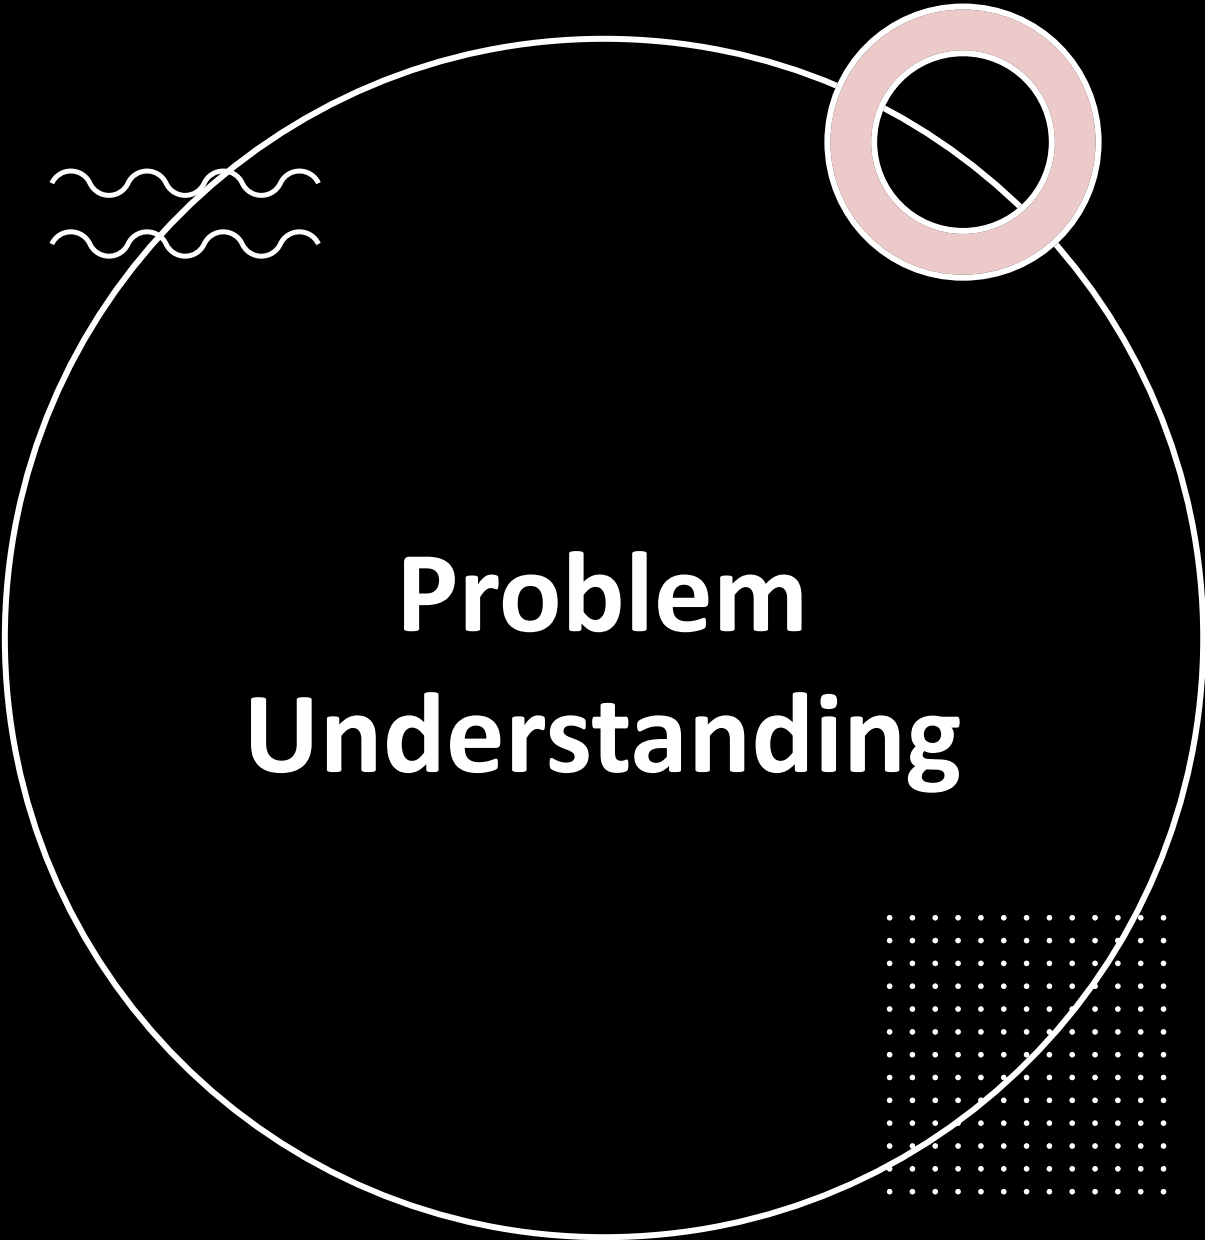

Build Less. Innovate More.

Domain – Machine
Subdomain – Autonomous AI Agent

Hack-A-Gent
BUILD LESS. INOVATE MORE.

Problem Understanding

What is the problem?

Hackathon participants spend most of their time on setup, boilerplate, debugging, documentation and deployment instead of improving their idea.

Who is affected?

- Students
- First-time hackathon participants
- Solo developers
- Small teams

Why does it matter?

Less time remains for innovation, resulting in unfinished features and weaker submissions.

Where does it occur?

Across school, college and professional software hackathons.

Research & Insights

Industry observations:

- AI coding tools are becoming mainstream.
- Hackathon teams still coordinate multiple tools manually.
- Time pressure reduces polish and experimentation.

Existing solutions:

- Claude Code – Great coding agent, not hackathon-aware.
- GitHub Copilot – Code completion only.
- OpenHands – Autonomous development, not end-to-end hackathon workflow.
- Devin – End-to-end engineering, expensive.
- Bolt/Lovable – Only web-app generation, limited submission automation.

Gap:

No existing tool automates the complete hackathon lifecycle.

Hack-A-Gent
BUILD LESS. INOVATE MORE.

Hack-A-Gent is an autonomous AI agent built specifically for hackathons.

It:

- Understands the problem statement
- Researches competitors
- Generates ideas
- Plans architecture
- Builds the MVP
- Tests & fixes errors
- Generates documentation
- Packages the final submission

Proposed Solution

Hack-A-Gent
BUILD LESS. INOVATE MORE.

Impact & Future Scope

Impact

- More time for innovation
- Higher-quality submissions
- Lower barrier for first-time hackers
- Less repetitive engineering

Future

- Multi-agent collaboration
- Judge-aware planning
- Automatic deployment
- GitHub integration
- Team collaboration

Thank You

Hack-A-Gent
BUILD LESS. INOVATE MORE.
